

onboarding

Download and Generate stitched clips from Session links

Setup Instructions

1. Install Poetry

This project uses [Poetry](#) for dependency management. If you don't have it, follow the [official installation guide](#).

2. Install ffmpeg

This project requires the [ffmpeg](#) command-line tool. The version used for development was [7.1.1_3](#).

If you are on macOS and have [Homebrew](#) installed, you can install it by running:

```
brew install ffmpeg
```

For other operating systems, please see the official [ffmpeg download page](#).

3. Install Dependencies

This command will create a virtual environment and install all Python dependencies from [pyproject.toml](#).

```
poetry install
```

4. Activate Virtual Environment

To work within the project's virtual environment, run:

```
poetry shell
```

This will spawn a new shell within the virtual environment.

5. Running the script

To process the [input.csv](#) and generate video clips, run:

```
poetry run process-videos
```

Make sure you have an `input.csv` file in the root of the project with columns: `title`, `video link`, `topic`, `start`, `end`. The output videos will be saved in directories named after the video titles.

Important Notes

Imp. variables

```
movement_threshold = new_width *  
recrop_persistence_frames  
fps = eval(video_stream.get('r_frame_rate', '30/1'))
```
